EGFR (Epidermal Growth Factor Receptor) is a receptor-type tyrosine kinase of the ErbB family and activates several downstream signaling cascades. In addition to EGFR (ErbB1, HER1), ErbB2 (HER2) and ErbB3 (HER3) are members of the ErbB family. EGFR has been reported to be associated with cancer, and its overexpression has been associated with progression, metastasis, and poor prognosis of cancer cells in head and neck cancer, lung cancer, and colorectal cancer.

Anti human EGFR, monoclonal antibody (EMab-134) is established against recombinant human EGFR.
